Sequence to sequence architecture

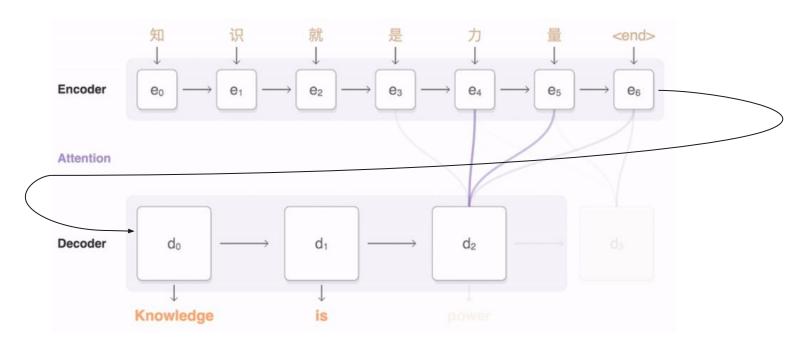

Problem: long range dependencies

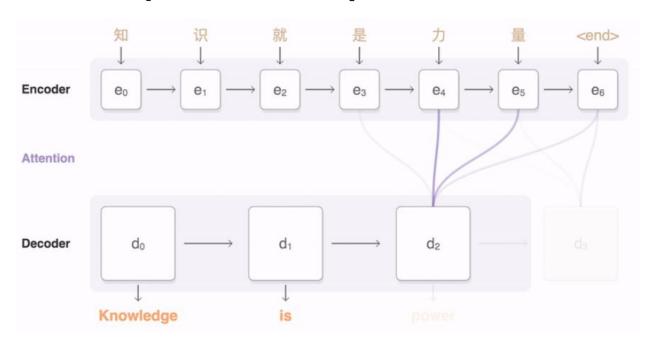

Attention mechanism

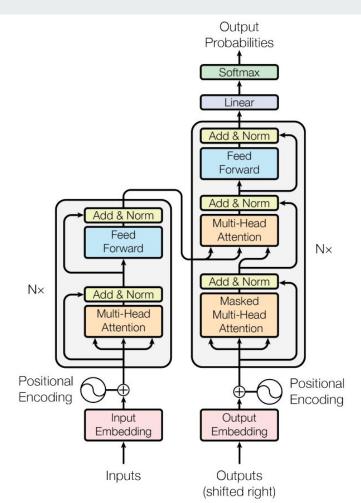

Attention mechanism

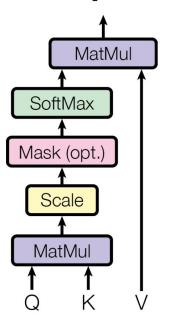

Problem: sequential computation

Transformer: Architecture overview

Scaled dot product attention

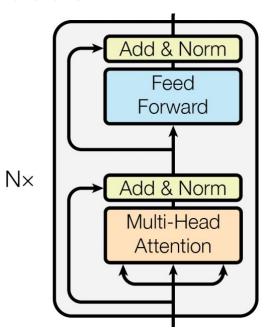

Attention $(Q, K, V) = \operatorname{softmax}(\frac{QK^T}{\sqrt{d_k}})V$

Q: query

K: key

V: value

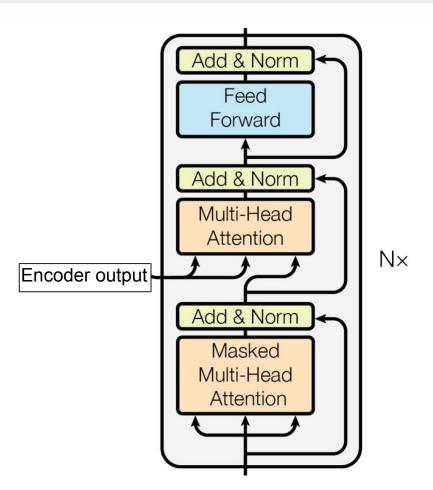

Encoder

x' = LayerNorm(x + Sublayer(x))

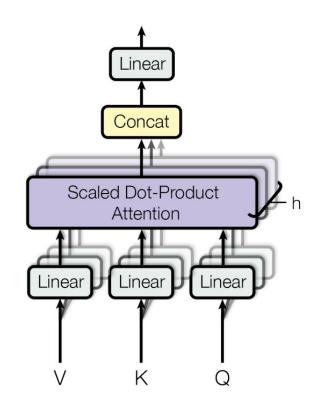

Decoder

x' = LayerNorm(x + Sublayer(x))

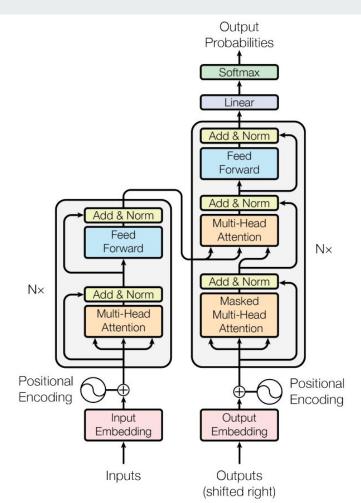

Multi-head attention

 $MultiHead(Q, K, V) = Concat(head_1, ..., head_h)W^O$ $where head_i = Attention(QW_i^Q, KW_i^K, VW_i^V)$

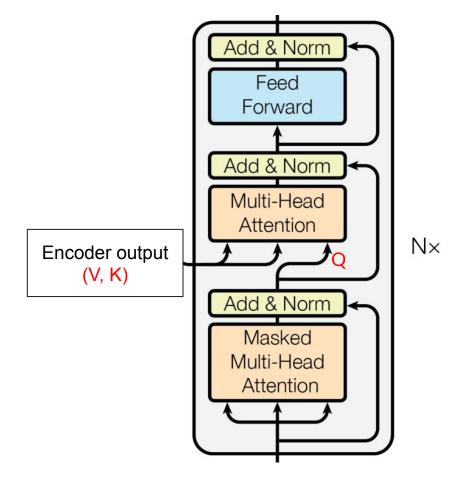

3 kinds of attention

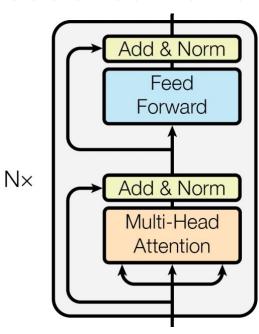

"Encoder-decoder attention"

V, K from encoder

Q from decoder

Encoder self-attention

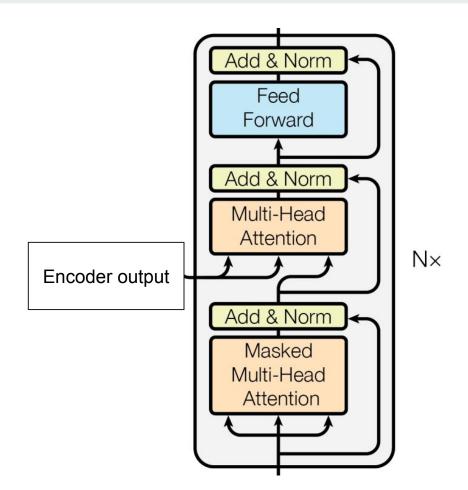

V, K, Q - previous layer output (or encoder input in first layer)

Decoder masked self-attention

V, K, Q - previous layer output (or decoder input in first layer)

Shifted right

All inputs on right are masked out.

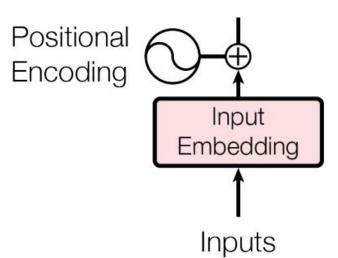

Positional encoding

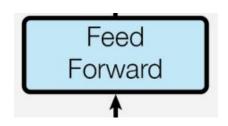

$$PE_{(pos,2i)} = sin(pos/10000^{2i/d_{\text{model}}})$$

 $PE_{(pos,2i+1)} = cos(pos/10000^{2i/d_{\text{model}}})$

$$PE_{(pos,2i+1)} = cos(pos/10000^{2i/d_{\text{model}}})$$

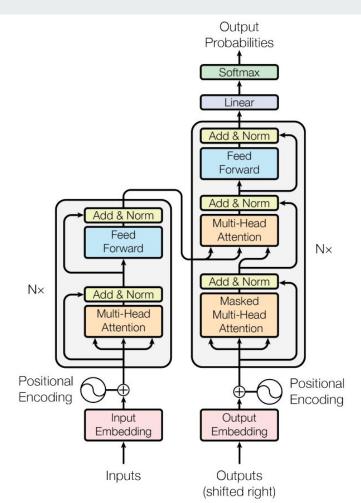

Position-wise feed forward block

 $FFN(x) = \max(0, xW_1 + b_1)W_2 + b_2$

Transformer: Architecture overview

Training

- Data set: WMT 2014 English-German dataset (4.5 M sentence pairs)
- Optimizer: Adam
- Regularisation
 - Residual droupout
 - Label smoothing

Results: machine translation

| Model | BL | EU | Training Cost (FLOPs) | | |
|---------------------------------|-------|-------|-----------------------|---------------------|--|
| Model | EN-DE | EN-FR | EN-DE | EN-FR | |
